# Python Basics

Python is a high-level, interpreted programming language known for its readable syntax. It is widely used in data science, web development, automation and AI.

Variables in Python are dynamically typed. Common built-in types include int, float, str, list, tuple, dict and set.

# Python Basics (continued)

Functions are defined with the def keyword. Python also supports classes, modules and packages for organizing code.

Virtual environments (venv) let you isolate project dependencies so different projects do not conflict.
